

# Semiconductor Materials

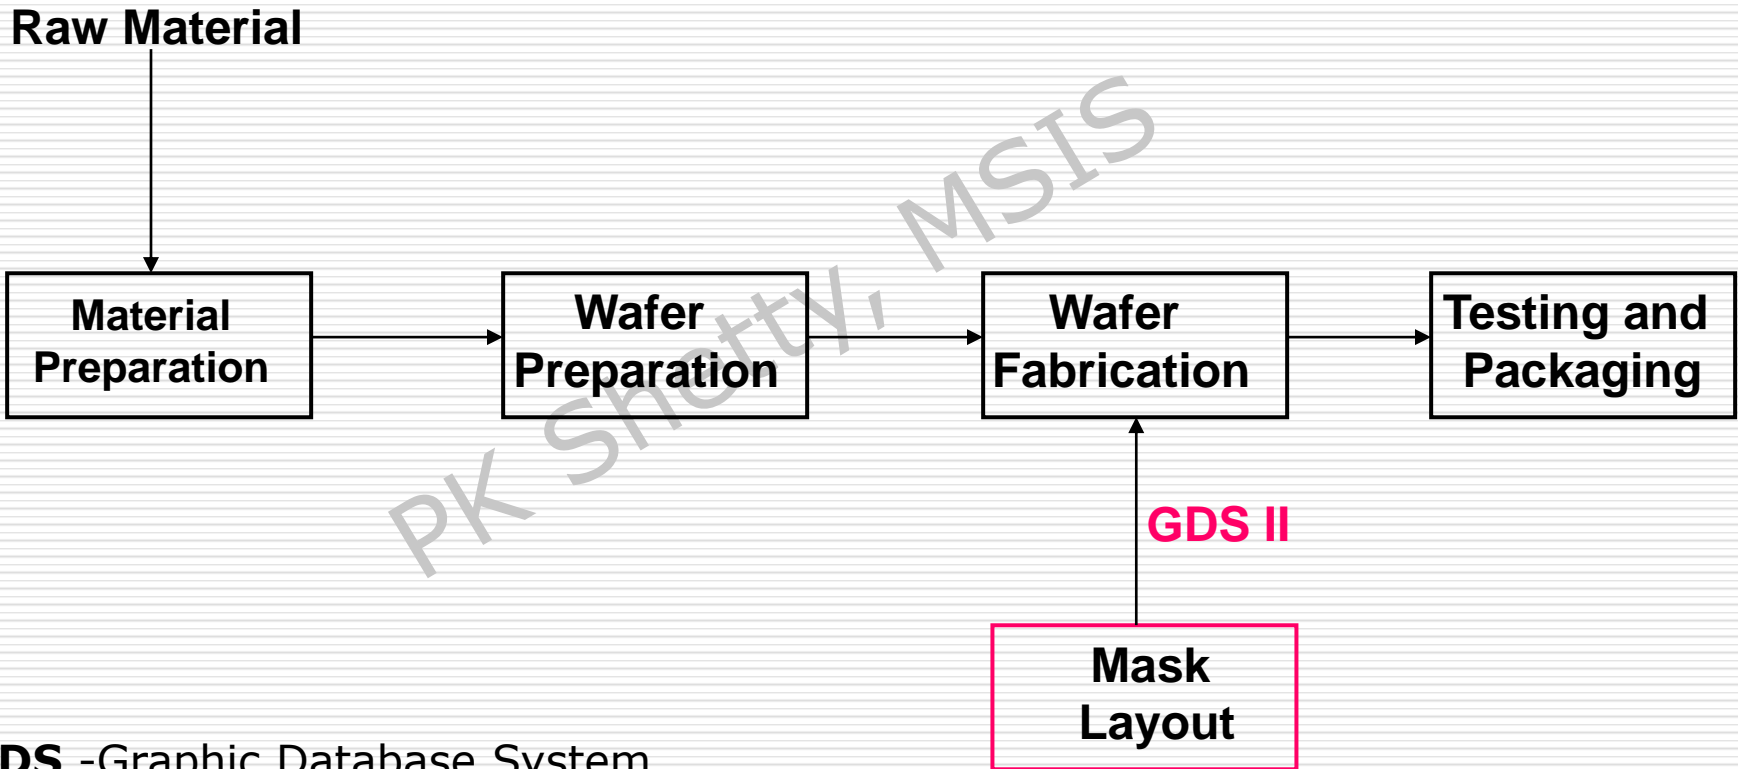

# Stages of IC Manufacturing

---

1. Material Preparation – raw material mined and purified.
  2. Wafer Preparation – Done in a separate dept. or supplied by vendors.
  3. Wafer Fabrication – Devices or ICs are actually formed on wafers (merchant / Captive producers)
  4. Testing and Packaging
-

# Stages of Manufacturing

---

Geometric Data Stream

---

# Atomic Structure

---

- ❑ There are 118 *elements*, and the entire universe is made from these elements
  - ❑ The smallest piece of any element that still retains its properties is called an *atom*
  - ❑ Atoms are the building block of the physical universe
-

# Atomic Structure

---

- ❑ Further subdivision of the atom will result in 3 subatomic particles: **Protons**, **Electrons** and **Neutrons**
  - ❑ They are arranged in a particular order which gives physical, chemical and electrical properties to the material
-

# Bohr Atomic Model

---

- The structure / organization of protons, electrons, neutrons are best explained by a model first proposed by a famous physicist, Niels Bohr in 1915

Bohr Atomic Model

Each orbit/shell has a max. number of positions available for electrons.

**Shells:** K, L, M, N, ...

**Capacity:** 2, 8, 18, 32, ...  $2n^2$

**Subshells:** s, p, d, f

$1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} \dots$

---

# Periodic Table

---

- ❑ It is the basic reference to the elements.
  - ❑ Elements range from the simplest, hydrogen, to the most complicated one, lawrencium.
  - ❑ In each atom of an element, the number of protons is equal to number of electrons.
  - ❑ **Atomic number** – no. of protons or electrons.
  - ❑ Each orbit **n** can hold  **$2n^2$**  electrons.
  - ❑ Elements with the same no. of outer-orbit (valence) electrons have similar properties and are grouped in the same column in the table.

# Periodic Table

---

- ❑ Elements are stable with a filled or with 8 electrons in the outer ring.
  - ❑ Atoms seek to combine with other atoms to create the stable condition of full orbits or 8 electrons in their outer ring through sharing.
-

# Electrical Conduction

---

- ☐ **Conductors**
  - ☐ **Insulators (Dielectrics)**
  - ☐ **Semiconductors**
-

# Conductors

---

- Conduct electricity
- The attractive hold of the protons in the nucleus of the atom on the electrons is relatively weak

Example:

<sup>29</sup> <b>Cu</b> Copper
<sup>47</sup> <b>Ag</b> Silver
<sup>79</sup> <b>Au</b> Gold

# Insulators (Dielectrics)

---

- Exhibit a large force of attraction between the nucleus and the orbiting electrons.

PK Shetty, MS16

---

# Semiconductors

III	IV	V
5 B	6 C	7 N
13 Al	14 Si	15 P
31 Ga	32 Ge	33 As
49 In	50 Sn	51 Sb
81 Tl	82 Pb	83 Bi

Elemental S.C.

III-V compound S.C.

Eg: GaAs, GaP etc

# Semiconductors

---

## □ Intrinsic Semiconductors - pure

Eg: Ge, Si

## □ Extrinsic Semiconductors - doped

Dopants that create **p**-type – accept**p**tors

Dopants that create **n**-type - don**n**ors

---

# Germanium and Silicon

---

- ❑ First transistor was made with Germanium.
- ❑ Disadvantages of Germanium:
  - \* Its  $937^{\circ}\text{C}$  melting point limits high temperature processing.
  - \* It lacks naturally occurring oxide which leaves the surface prone to electrical leakage.

But Silicon allows higher temperature processing (melting point:  $1415^{\circ}\text{C}$ ) and represents 90% of the wafers processed worldwide.

---

# Compound Semiconducting materials

---

- ❑ Most used in commercial compound semiconductor devices are:
    - Gallium Arsenide (GaAs)
    - Gallium Arsenide Phosphide (GaAsP)
  - ❑ Diodes made from GaAs and GaAsP gives off visible and laser light. Hence they make the LEDs.
  - ❑ GaAs has high carrier mobility, hence can be used for high speed circuits. Devices of GaAs operate 2 to 3 times faster than their silicon counterparts.
  - ❑ GaAs is naturally *radiation hardened* - space application
  - ❑ GaAs is semi-insulating – minimizes leakage between adjacent devices, allowing higher packing density – faster circuit.
-

# Drawbacks:

---

- ❑ Trade-offs between performance & processing difficulty.
  - ❑ Majority of electronic products do not require their level of speed.
  - ❑ Do not possess a natural oxide. Layers of dielectrics must be deposited on the GaAs – longer processing and low yield.
  - ❑ Half of the atoms in GaAs are Arsenic, an element very dangerous to human beings which evaporates from the compound at normal process temperatures.
  - ❑ The same problem occurs during the crystal growing stage resulting in nonuniform crystals and wafers.
-
